Problem Description

Given an array, **arr[]** of size **N**, the task is to find the count of array indices such that removing an element from these indices makes the sum of even-indexed and odd-indexed array elements equal.

Problem Constraints

$1 <= n <= 10^5$
$-10^5 <= A[i] <= 10^5$

Input Format

First argument contains an array A of integers of size N

Output Format

Return the count of array indices such that removing an element from these indices makes the sum of even-indexed and odd-indexed array elements equal.

Example Input

Input 1:

```
A=[2, 1, 6, 4]
```

Input 2:

```
A=[1, 1, 1]
```

Example Output

Output 1:

```
1
```

Output 2:

```
3
```

Example Explanation

Explanation 1:

```
Removing arr[1] from the array modifies arr[] to { 2, 6, 4 } such that, arr[0] + arr[2] = arr[1].
Therefore, the required output is 1.
```

Explanation 2:

```
Removing arr[0] from the given array modifies arr[] to { 1, 1 } such that arr[0] = arr[1]
Removing arr[1] from the given array modifies arr[] to { 1, 1 } such that arr[0] = arr[1]
Removing arr[2] from the given array modifies arr[] to { 1, 1 } such that arr[0] = arr[1]
Therefore, the required output is 3.
```
