Problem Description

You are given an integer **T** denoting the number of test cases. For each test case, you are given an integer array **A**.
You have to put the odd and even elements of array **A** in 2 separate arrays and print the new arrays.
NOTE: Array elements should have the same relative order as in **A**.

Problem Constraints

1 <= **T** <= 10
1 <= **|A|** <= 10⁵
1 <= **A[i]** <= 10⁹

Input Format

First line of the input contains a single integer **T**.
For each test case:

- First line consists of a single integer **|A|** denoting the length of array.
- Second line consists of **|A|** space separated integers denoting the elements of array **A**.

Output Format

For each test case:

- First line should contain an array of space separated integers containing all the odd elements of array **A**
- Second line should contain an array of space separated integers containing all the even elements of array **A**

Example Input

Input 1:
2
5
1 2 3 4 5
3
4 3 2

Input 2:
2
3
2 2 2
2
1 1

Example Output

Output 1:
1 3 5
2 4
3
4 2

Output 2:
2 2 2
1 1

Example Explanation

Explanation 1:
Test Case 1:
Odd elements in the array(in the order they occur) are: 1, 3, 5.
Even elements in the array(in the order they occur) are: 2, 4.

Test Case 2
Odd elements in the array(in the order they occur) are: 3.
Even elements in the array(in the order they occur) are: 4, 2.

Explanation 2:
Test Case 1:
There are no odd elements in the array.
Even elements in the array(in the order they occur) are: 2, 2, 2.

Test Case 2
Odd elements in the array(in the order they occur) are: 1, 1.

Test

Test With Custom Input

Submit

Odd elements in the array(in the order they occur) are: 1, 1.
There are no even elements in the array.
